Software engineer, 4 years at Meta across tooling for AI coding agents and developer build systems.

EXPERIENCE

Meta Platforms

Software Engineer - Code Search & Indexing

London, UK | Jun 2025 - Present

- Built a local code-search library mirroring server-side search that resolves small-directory queries locally, cutting agent server calls by **40%** and speeding up tool calls $\sim 5\times$ on average.
- Led development of an agent-focused CLI matching ripgrep's interface but running on Meta's server-side search, giving agents a familiar tool over a codebase too large to search locally.
- Validated the CLI against existing MCP code-search tool on remote Codex agent tasks, establishing quality parity before rollout.
- Increased the share of agent queries returning results by $\sim 10\%$ on Meta's internal code-search MCP (millions/day) via relaxation on misses - widening directory scope, falling back from exact-string to regex, and treating multi-term queries as intersection matches.
- Designed test and deployment pipeline for a new Glean indexing command in Pyrefly - Meta's open-source Python type checker - powering Python code navigation.

Software Engineer - Mobile GraphQL Runtime

New York, NY | Jan 2024 - Jun 2025

- Maintained and extended the mobile client runtime serving every GraphQL query across nearly all Meta apps on iOS and Android.
- Cut redundant profile-picture downloads and UI flicker on Instagram Android by detecting content-equivalence across rotating anti-phishing CDN URLs and suppressing the consistency engine's no-op updates for unchanged images.
- Led fallback-cache project for Instagram Android GraphQL: a per-query mode that serves stale data only after a $\sim 3s$ network timeout instead of upfront, so a failed request no longer flashes stale data before erroring out.

Software Engineer - Wearables Developer Infrastructure

New York, NY | Jun 2022 - Jan 2024

- Built and rolled out incremental Android builds across multiple Meta hardware teams, reducing CI build time by **25%**, from **~ 60 to 45 minutes**, across tens of thousands of builds/day.
- Led cross-device build linking across multiple hardware targets, partnering with QA to eliminate a class of version-mismatch bugs.
- Automated library ingestion into the Android build - previously a fully manual process - adding failure detection and size-regression checks.

PROJECTS

Built with agentic coding workflows using Claude Code and Codex.

TeekayPics - macOS RAW photo editor (Swift/SwiftUI)

- Built a macOS RAW editor with GPU-accelerated adjustments, curve editing, SAM3-powered click-to-mask selection, LibRaw demosaic, and JPEG/HEIF export.

aahan.dev - personal site & interactive browser tools

- Built a static GitHub Pages site with interactive Rust to WebAssembly tools (a Desmos-style equation grapher and a falling-sand simulation) and a Cloudinary-backed photo gallery.

EDUCATION

Purdue University, West Lafayette

Aug 2021 - May 2022

M.S. Computer Science | GPA 3.81

Purdue University, West Lafayette

Aug 2017 - May 2021

B.S. Computer Science | GPA 3.91

SKILLS

Languages: Rust, Python, C++, Hack, Java, TypeScript, JavaScript, Shell

Frameworks & Tools: GraphQL, MCP, Bazel, git/hg, Claude Code, Codex
